Package 'genomicper'

February 23, 2026

Type Package

Title Circular Genomic Permutation using Genome Wide Association p-Values

Version 1.8

Date 2026-02-21

Maintainer Claudia P Cabrera <c.cabrera@qmul.ac.uk>

Imports stats,grDevices,utils,graphics

Description

Circular genomic permutation approach uses genome wide association studies (GWAS) results to establish the significance of pathway/gene-set associations whilst accounting for genomic structure. All single nucleotide polymorphisms (SNPs) in the GWAS are placed in a 'circular genome' according to their location. Then the complete set of SNP association p-values are permuted by rotation with respect to the SNPs' genomic locations. Two testing frameworks are available: permutations at the gene level, and permutations at the SNP level. The permutation at the gene level uses Fisher's combination test to calculate a single gene p-value, followed by the hypergeometric test. The SNP count methodology maps each SNP to pathways/gene-sets and calculates the proportion of SNPs for the real and the permutated datasets above a pre-defined threshold. Genomicper requires a matrix of GWAS association p-values and SNPs annotation to genes. Pathways can be obtained from within the package or can be provided by the user. Cabrera et al (2012) <doi:10.1534/g3.112.002618> .

demo *GWAS p_values demo data*

Description

GWAS p-values (tab delimited file). First Column must contain the SNP ids and the column name = "name"

Usage

```
data(demo)
```

Format

A data frame with SNPs identifiers and gwas p-values of association

`name` a character vector

`Trait1` a numeric vector

`Trait2` a numeric vector

`Trait3` a numeric vector

`Trait4` a numeric vector

`Trait5` a numeric vector

`Trait6` a numeric vector

`Trait7` a numeric vector

`Trait8` a numeric vector

`Trait9` a numeric vector

```
name       Trait1      Trait2    Trait3   Trait4  Trait5    Trait6
rs10000010 0.9122360 0.30088096 0.2332038 0.5193068 0.1255104 0.07253145
rs10000023 0.8642906 0.52064064 0.9243443 0.7177759 0.9512171 0.81716250
rs10000030 0.2832705 0.99021664 0.8359339 0.9662707 0.8491221 0.50208681
```

Examples

```
#Read input demo file for "read_pvals" function
data(demo)
```

`genes_permutation` *Gene-level Permutations*

Description

Performs gene-level circular genomic permutations. In each permutation,the complete set of SNP association p-values are permuted by rotation with respect to the SNPs' genomic locations. Once these 'simulated' p-values are assigned,the joint gene p-values are calculated using Fisher's combination test,and pathways' association tested using the hypergeometric test

Usage

```
genes_permutation(ordered_alldata = "", pers_ids = "", pathways = "",
ntraits = "", nper = 100, threshold = 0.05, seed=10,saveto = "workspace",
gs_locs="", envir = "")
```

Arguments

ordered_alldata	Return variable from "genome_order". Ordered genome and trait p-values
gs_locs	Return variable from "genome_order". SNP indexes
pers_ids	Return variable "per_ors" from "read2_paths". Gene indexes
pathways	Return variable "pathways" from "read2_paths"
ntraits	Traits INDEX to be analysed. Index according to "ordered_alldata". Trait Columns index must start at 7. Example: ntraits=c(7:9), ntraits=7
nper	Number of permutations.Example: nper=1000
threshold	Threshold to be set by the hypergeometric test. threshold=0.05
seed	Set a number for random sampling
saveto	Save permutation results to "workspace" OR "directory"
envir	R environment to save the data to when saveto is set to "workspace"

Value

Returns "Permus_trait" variables or files (permutation datasets).

References

Imports phyper (from stats)

```

---

genome_order *Genome Order*

Description

Orders the SNPs according to their genomic location

Usage

```
genome_order(all_data = "")
```

Arguments

all_data	SNPs to Genes Annotation and Trait Pvalues of Association all_data = (read_pvals output) OR matrix/dataframe.

Details

```
Input Columns with "*" must be included for analysis

NOTE: Trait p-values must start at Column #7

# *Column 1: "name" (SNP_IDs - any SNP ID as character)
# *Column 2: Chromosome Location
# *Column 3: SNP Location
# *Column 4: Gene ID
# Column 5: Symbol (OR Annotation Field 1)
# Column 6: Annotaiton Field 2
# *Column 7: First trait pvalues of association
# Column N: Next trait pvalues of association
# Example Input Data:
name       Chromosome  Location GENE_ID Symbol Orientation abpi

get_results *Circular Permutation Results*

Description

Creates a summary dataframe of the genomic permutations datasets

Usage

```
get_results(res_pattern="Permus",level="snp",from="workspace",
threshold=0.05,envir = "")
```

Arguments

res_pattern	Pattern of the Permutation files/variable. eg. res=pattern="Permus"
level	Permutation level performed.level values "snp" or "gene"
from	Location of the permutation datasets.from values "workspace" or "directory"
threshold	Threshold of significance set
envir	R environment where save the data to

Value

results	Data frame with Pathway ID, Trait, Threshold set by permutations, Gene results include the theoretical hypergeometric p-value and the, observed (Empirical Hypergeometric p-values) SNP results include the count of significan SNPs and the overall score Score is the proportion of tests observed with more significant results

Format

```
## SNP level results
     PathID    Trait Threshold RealCount Score

`hyprbg` *Hypergeometric Test (phyper)*

Description

Performs Hypergeometric test (phyper() from R)

Usage

```
hyprbg(Sig_in_Paths, uniSig, gns_in_Paths, universe)
```

Arguments

`Sig_in_Paths`	Number of significant genes in the pathway
`uniSig`	Number of significant genes in the dataset
`gns_in_Paths`	Number of genes in the pathway
`universe`	Number of genes in the dataset

Value

Returns hypergeometric test

References

hyprbg Imports phyper() (from stats)

plot_results *Plot Results Circular Permutation*

Description

QQ plots

Usage

```
plot_results(results="",by="",plot_all=TRUE, var = "", save_plot=TRUE, plot_name="",
bf= FALSE , save_qq = TRUE)
```

Arguments

results	Results datarame from "get_results()"
by	Visualize results by "trait" OR by "set"
plot_all	plot_all = TRUE plots all the variables in the results dataframe and saves a pdf file in the working directory. Setting plot_all to FALSE plots a single variable(trait or set). The argument "var" must be declared.
var	Variable name to plot
save_plot	save_plot = TRUE saves the plots in the working directory. save_plot = FALSE the plot is visualized at the console. save_plot = FALSE can be used only when plot_all is set to FALSE. The plot displayed at the console is interactive, clicking on a point displays the points name.
plot_name	Argument used to save the file name for the plots. Default value = Results_genomicper_[set/trait]
bf	Displays the bonferroni correction
save_qq	TRUE returns the qq plot values

Value

qq	Data frame with qq plot values

```

`read2_paths` *Read to SNPs to sets; Map SNPs to gene-sets/pathways*

Description

Reads the sets/pathways, map the SNPs and genes to the gene-sets/pathways read2_paths uses the "genome_order" output(ordered_alldata, gs_locs) to assign genomic location indexes to each element in the gene-set. The permutation method must be defined (i.e. level = "snp" OR level = "gene").

Usage

```
read2_paths(ordered_alldata="",gs_locs="",sets_from="workspace",
sets_prefix="RHSA",level="snp",envir="")
```

Arguments

`ordered_alldata`
: Ordered data according to the SNPs genomic location. Traits start at column 7 Return variable from:

genome_results <-genome_order(all_data=all_data)
ordered_alldata <- genome_results$ordered_alldata

`gs_locs` Gene annotation,indexes and number of observations
Return variable from genome_order():
genome_results <-genome_order(all_data=all_data)
gs_locs <- genome_results$gs_locs

`sets_from` Location of the gene-sets. Default set to "workspace"
sets_from="workspace" OR sets_from="directory"
"directory", only will search for information in the working directory.

`sets_prefix` Prefix of the gene-set variables or files.
Default set to sets_prefix= "RHSA" e.g. Variables "RHSA164843","RHSA446343","RHSA8876384"
each variable/file contains the list of gene identifiers part of that pathway

`level` The level at which the permutations will be performed. Assigns the indexes according to snps or genes
Default value "snp" level values = "snp" OR "gene"

`envir` R environment where pathway data is stored. e.g(envir=.GlobalEnv, envir=gper.env)

Value

`pathways` Pathway Id, Description,Number of Genes in the pathway, Number of genes found in the dataset, Number of SNPs found in the dataset

`per_ors` A list of identifiers mapped to each pathway

Format

```
Input: Ordered_alldata

read_pvals *Read GWAS p-values of association and Merge with SNP annotations*

Description

Read GWAS p-values of association and Merge with SNP annotations for analysis

Usage

```
read_pvals(data_name="",snps_ann="",from="workspace")
```

Arguments

data_name	GWAS p_values (tab delimited file)(SNP_IDs Trait1 Trait2 ...TraitN)
snps_ann	SNPs Annotation (SNPsAnnotation). Genomicper uses entrez gene ids to annotate associate SNPs-to genes-pathways. The annotation MUST match your data input (coordinates and chromosome format) Any SNP ID is valid, as long the ID is set as character The examples below show an option on how to annotate the SNPs prior the use of genomicper
from	Datasets location. Values "workspace" OR "directory"

Value

Dataframe: name; chromosome; Location; GeneID; Symbol; Orientation; Trait1; TraitN

Formats

```
GWAS p_values (tab delimited file)(SNP_IDs Trait1 Trait2 ...TraitN)
name       Trait1      Trait2    TraitN
rs10000010 0.9122360 0.30088096 0.2332038
rs10000023 0.8642906 0.52064064 0.9243443
rs10000030 0.2832705 0.99021664 0.8359339

SNPs Annotation (SNPsAnnotation)
name        Chromosome  Location  GENE_ID   Symbol    Orientation
rs1000313   1           15405489  23254     KIAA1026  +
rs1000533   1           168282491 9095      TBX19     +
rs1000731   1           231963491 27185     DISC1     +

Output:
name       Chromosome  Location GENE_ID Symbol Orientation   Trait1
rs10000010          4  21618674   80333 KCNIP4           - 0.9122360
rs10000023          4  95733906     658 BMPR1B           + 0.8642906
rs10000030          4 103374154      NA   <NA>        <NA> 0.2832705

```

RHSAXXXXX *Reactome Pathway examples*

Description

Each file "RHSAXXXX" contains the gene identifiers.

Usage

```
data(RHSA164843)
```

Format

The format is: num [1:6] 11168 155030 155348 155459 155908 2547...

```

SNPsAnnotation *SNPs-Genes annotation to Distance 0 (SNPs within a gene)*

Description

SNPs annotated to genes. Annotation only when the SNPs fall
within start and end of transcription of the genes.

Usage

```
data(SNPsAnnotation)
```

Format

Sample data frame with 339096 SNP observations on the following 6 variables.

`name` a character vector

`Chromosome` a character vector

`Location` a numeric vector of the SNP location

`GENE_ID` a numeric vector with entrez geneID

`Symbol` a character vector ; other annotation slot 1

`Orientation` a character vector; other annotation slot 2

```
name      Chromosome  Location  GENE_ID    Symbol     Orientation
rs1000313          1  15405489    23254    KIAA1026             +
rs1000533          1 168282491     9095    TBX19                +

```

`snps_permutation` *SNP-level permutations*

Description

Performs SNP-level circular genomic permutations. In each permutation, the complete set of SNP association p-values are permuted by rotation with respect to the SNPs' genomic locations.
Once these 'simulated' p-values are assigned,the proportion of SNPs per set above a pre-defined threshold is calculated

Usage

```
snps_permutation(ordered_alldata = "", pers_ids = "", ntraits = "",
nper = 100, threshold = 0.05, seed=10,saveto = "workspace",
gs_locs = "",envir ="")
```

Arguments

`ordered_alldata`	Return variable from "genome_order". Ordered genome and trait p-values
`gs_locs`	Return variable from "genome_order". SNP indexes
`pers_ids`	Return variable "per_ors" from "read2_paths". SNP indexes
`ntraits`	Traits INDEX to be analysed. Index according to "ordered_alldata". Trait Columns index must start at 7. Example: ntraits=c(7:9), ntraits=7
`nper`	Number of permutations.Example: nper=1000
`threshold`	Threshold to be set by the hypergeometric test. threshold=0.05
`seed`	Set number for random sampling
`saveto`	Save permutation results to "workspace" OR "directory"
`envir`	R environment to save the Permutations to when saveto is set to "workspace"

Value

Returns "Permus_genesetsname" variables or files (permutation datasets).
